

GENETIC TESTING: MULTISYSTEM INHERITED DISORDERS, INTELLECTUAL DISABILITY, AND DEVELOPMENTAL DELAY

OVERVIEW

Genetic testing for rare hereditary diseases may be used to confirm a diagnosis in a patient who has signs and/or symptoms of a rare disease, but conventional diagnostic methods have been unsuccessful. Confirming the diagnosis may alter some aspects of management and may eliminate the need for further diagnostic workup. This document addresses genetic testing for rare genetic conditions that impact multiple body systems.

POLICY REFERENCE TABLE

Below are a list of higher volume tests and the associated laboratories for each coverage criteria section. This list is not all inclusive.

Coverage Criteria Sections	Example Tests; Labs	Common CPT Codes	Common ICD Codes	Ref
Known Familial Variant Analysis for Multisystem Inherited Disorders				
Known Familial Variant Analysis	Targeted Mutation Analysis for a Known Familial Variant	81403, 81303, 81221		
Developmental Delay/Intellectual Disability, Autism Spectrum Disorder, or Congenital Anomalies				
Chromosomal Microarray Analysis	Chromosomal Microarray (GenomeDx) (GeneDx)	81229	F84.0, Q89.7, R62.50, F79	3, 5
	Chromosomal Microarray, Postnatal, ClariSure Oligo-SNP (Quest Diagnostics)			

	SNP Microarray–Pediatric (Reveal®) (LabCorp)			
Developmental Delay/Intellectual Disability, Autism Spectrum Disorder, or Congenital Anomalies Panel Analysis	Neurodevelopmental Panel (Invitae)	81405, 81406, 81407, 81470, 81471, 81479	F70-80, F84, F81, F82, F88, F89, H93.52	4, 6, 33
	Autism/ID Panel, Autism/ID Xpanded panel (GeneDx)			
	SMASH (Marvel Genomics)	0156U		
Angelman/Prader-Willi Syndrome				
SNRPN/UBE3A methylation analysis, 15q11-q13 FISH analysis, chromosome 15 uniparental disomy analysis, and imprinting center defect analysis	Angelman Syndrome/Prader-Willi Syndrome Methylation Analysis (GeneDx)	81331	R47, Q93.51, Q93.5	7, 24
	FISH, Prader-Willi/Angelman Syndrome (Quest Diagnostics)	88271, 88273		
	Chromosome 15 UPD Analysis (Greenwood Genetic Center)	81402		
	Imprinting Center (IC) Deletion Analysis for Angelman Syndrome (Univ of Chicago Genetic Services Laboratories)	81331		
	Imprinting Center (IC) Deletion Analysis for Prader-Willi Syndrome (Univ of Chicago Genetic Services Laboratories)			
Beckwith-Wiedemann/Russell-Silver Syndrome				
H19 and KCNQ1OT1 methylation analysis, FISH or deletion/duplication analysis of 11p15, uniparental disomy analysis, CDKN1C sequencing and/or deletion/duplication analysis	Beckwith-Wiedemann Syndrome: H19 Methylation (EGL Laboratories)	81401	C22.2, C64, I42.9, P08, R16.0- R16.2, R62.52, Q35, Q38.2, Q63, Q79.2, Q87.3	11, 12, 25
	Russell-Silver Syndrome: H19 Methylation (EGL Laboratories)			
	Beckwith-Wiedemann: Methylation analysis of 11p15.5 only (Univ of Pennsylvania Genetic Diagnostic Lab)	81401		
	RSS: Methylation analysis of 11p15.5 only (Univ of Pennsylvania Genetic Diagnostic Lab)			

	Beckwith-Wiedemann: 11p15.5 high resolution copy number analysis only (aCGH) (Univ of Pennsylvania Genetic Diagnostic Lab)	81479		
	RSS: 11p15.5 high resolution copy number analysis only (aCGH) (Univ of Pennsylvania Genetic Diagnostic Lab)			
	Uniparental Disomy (Mayo Clinic Laboratories)	81402		
	CDKN1C Full Gene Sequencing and Deletion/Duplication (Invitae)	81479		
CADASIL				
NOTCH3 Sequencing and/or Deletion/Duplication Analysis	NOTCH3 Full Gene Sequencing and Deletion/Duplication (Invitae)	81406, 81479	I67.850, F02.80, F02.81	8, 9, 10
Cystic Fibrosis				
CFTR Sequencing and/or Deletion/Duplication Analysis	Cystic Fibrosis Complete Rare Variant Analysis, Entire Gene Sequence (Quest Diagnostics)	81223	E84.0-9, P09, Q55.4, R94.8, Z13, Z31, Z34, Z82.79, Z83, Z84	1, 30
	Cystic Fibrosis Gene Deletion or Duplication (Quest Diagnostics)	81222		
CFTR Intron 9 PolyT and TG Analysis (aka Intron 8 poly-T/TG)	CFTR Intron 8 Poly-T Analysis (Quest Diagnostics)	81224		
CHARGE Syndrome				
CHD7 Sequencing and/or Deletion/Duplication Analysis	CHARGE and Kallman Syndromes via the CHD7 Gene (PreventionGenetics)	81407, 81479	Q89.8	13, 14
Fanconi Anemia				
Fanconi Anemia Panel	FancZoom (DNA Diagnostic Laboratory - Johns Hopkins Hospital)	81479	C92, D46.9, D61.09, D61.89,	31
	Fanconi Anemia Panel	81162, 81307,		

	(PreventionGenetics)	81479	D61.9, L81.3, L81.4 Q02, R62.52	
Fragile X Syndrome				
FMR1 Repeat and Methylation Analysis	Fragile X, PCR and Southern Blot Analysis (Labcorp)	81243, 81244	F84.0, Q99.2, F79, E28.3, G11.2, G25.2	15
	XSense, Fragile X with Reflex (Quest Diagnostics)			
	Fragile X Syndrome (Sema4)	81243		
Hereditary Hemorrhagic Telangiectasia (HHT)				
Hereditary Hemorrhagic Telangiectasia Panel	HHTNext (Ambry Genetics)	81405, 81406, 81479	R04.0, Q27.30- Q27.39	16, 17, 18
	Hereditary Hemorrhagic Telangiectasia and Vascular Malformations Panel (Invitae)			
Legius Syndrome				
SPRED1 Sequencing and/or Deletion/Duplication Analysis	SPRED1 Full Gene Sequencing and Deletion/Duplication (Invitae)	81405, 81479	L81.3, Z82.79, Z84	21
	Legius Syndrome via the SPRED1 Gene (PreventionGenetics)			
Neurofibromatosis				
NF1 or NF2 Sequencing and/or Deletion/Duplication Analysis or Multigene Panel	NF1 Sequencing & Del/Dup (GeneDx)	81408	L81.3, R62.5, Q85.0, Z82.79, Z84	2
	Neurofibromatosis Type 2 via the NF2 Gene (PreventionGenetics)	81405, 81406		
Noonan Spectrum Disorders				
Noonan Spectrum Disorders Multigene Panel	RASopathies and Noonan Spectrum Disorders Panel (Invitae)	81442	F82, R62.52, Q24, Q87.19, R62.0, R62.50, R62.59, Q53, Q67.6, Q67.7, L81.4, L81.3	19, 20, 21
	Noonan and Comprehensive RASopathies Panel (GeneDx)			
PIK3CA-Related Segmental Overgrowth and Related Syndromes				

PIK3CA Sequencing and/or Deletion/Duplication Analysis	PIK3CA Full Gene Sequencing and Deletion/Duplication (Invitae)	81479		32
Rett Syndrome				
MECP2 Sequencing and/or Deletion/Duplication Analysis	MECP2 Full Gene Sequencing and Deletion/Duplication (Invitae)	81302, 81304	F70-F79, F80, F81, F82, F84, F88, F89, Z13.4, Z82.79, Z84	22, 23
	MECP2 Gene Sequencing & Del/Dup (GeneDx)			
Tuberous Sclerosis Complex (TSC)				
TSC1 and TSC2 Sequencing and/or Deletion/Duplication Analysis	TSC1 Full Gene Sequencing and Deletion/Duplication (Invitae)	81405, 81406	D10, D15.1, D43, D21.9, H35.89, N28.1, Q61.9, H35.89	26
	TSC2 Full Gene Sequencing and Deletion/Duplication (Invitae)	81406, 81407		
Other Covered Multisystem Inherited Disorders				
Other Covered Multisystem Inherited Disorders	See below	81400-81408		27, 28, 29

OTHER RELATED POLICIES

This policy document provides coverage criteria for Multisystem Inherited Disorders, Intellectual Disability, and Developmental Delay. For system specific genetic disorders, please refer to:

- *Genetic Testing: Epilepsy, Neurodegenerative, and Neuromuscular Disorders*
- *Genetic Testing: Hematologic Conditions (non-cancerous)*
- *Genetic Testing: Gastroenterologic Conditions (non-cancerous)*
- *Genetic Testing: Cardiac Disorders*
- *Genetic Testing: Aortopathies and Connective Tissue Disorders*
- *Genetic Testing: Hearing Loss*
- *Genetic Testing: Eye Disorders*
- *Genetic Testing: Immune, Autoimmune, and Rheumatoid Disorders*
- *Genetic Testing: Kidney Disorders*

- *Genetic Testing: Lung Disorders*
- *Genetic Testing: Metabolic, Endocrine, and Mitochondrial Disorders*

For other related testing, please refer to:

- **Genetic Testing: Noninvasive Prenatal Screening (NIPS)** for coverage criteria related to cell-free fetal DNA screening tests.
- **Genetic Testing: Prenatal Diagnosis (via amniocentesis, CVS, or PUBS) and Pregnancy Loss** for coverage related to prenatal and pregnancy loss diagnostic genetic testing for tests intended to diagnose genetic conditions following amniocentesis, chorionic villus sampling or pregnancy loss.
- **Genetic Testing: Prenatal and Preconception Carrier Screening** for coverage criteria related to prenatal carrier screening, preimplantation testing of embryos, or preconception carrier screening.
- **Genetic Testing: Whole Exome and Whole Genome Sequencing for the Diagnosis of Genetic Disorders** for coverage criteria related to exome and genome sequencing for genetic disorders.

COVERAGE CRITERIA

KNOWN FAMILIAL VARIANT ANALYSIS FOR MULTISYSTEM INHERITED DISORDERS

- I. Targeted mutation analysis for a known familial variant (81403, 81303, 81221) for a multisystem inherited disorder is considered **medically necessary** when:
 - A. The member has a [close relative](#) with a known pathogenic or likely pathogenic variant causing the condition.
- II. Targeted mutation analysis for a known familial variant (81403, 81303, 81221) for a multisystem inherited disorder is considered **investigational** for all other indications.

[back to top](#)

DEVELOPMENTAL DELAY/INTELLECTUAL DISABILITY, AUTISM SPECTRUM DISORDER, OR CONGENITAL ANOMALIES

Chromosomal Microarray Analysis

- I. Chromosomal microarray analysis (81229) is considered **medically necessary** when:
 - A. The member has [developmental delay/intellectual disability](#), excluding: idiopathic growth delay and isolated speech/language delay (see below)
OR
 - B. The member has [autism spectrum disorder](#). **OR**
 - C. The member has [multiple congenital anomalies](#) not specific to a well-delineated genetic syndrome.
- II. Chromosomal microarray is considered **investigational** for all other conditions of delayed development, including:
 - A. [Idiopathic growth delay](#)
 - B. Isolated speech/language delay.

Developmental Delay/intellectual Disability, Autism Spectrum Disorder, or Congenital Anomalies Panel Analysis

- I. The use of autism spectrum disorder, intellectual disability, or developmental delay multigene panel analysis (0156U, 81470, 81471, 81479) is considered **investigational**.

[back to top](#)

ANGELMAN/PRADER-WILLI SYNDROME

SNRPN/UBE3A Methylation Analysis, 15q11-q13 FISH Analysis, Chromosome 15 Uniparental Disomy Analysis, and Imprinting Center Defect Analysis

- I. *SNRPN/UBE3A* methylation analysis (81331), FISH analysis for 15q11-q13 deletion (88271, 88273), uniparental disomy analysis (81402), and imprinting center defect analysis (81331) to establish or confirm a diagnosis of Angelman or Prader-Willi syndrome is considered **medically necessary** when:
 - A. The member meets all of the following clinical features of Angelman syndrome:
 1. Developmental delay by age six to 12 months, eventually classified as severe, **AND**
 2. Speech impairment, with minimal to no use of words; receptive language skills and nonverbal communication skills higher than expressive language skills, **AND**
 3. Movement or balance disorder, usually ataxia of gait and/or tremulous movement of the limbs, **AND**
 4. Unique behavior, including any combination of frequent laughter/smiling; apparent happy demeanor; excitability, often with hand-flapping movements and hypermotoric behavior, **OR**
 - B. The member meets one of the following age-specific features of Prader-Willi syndrome:
 1. The member is age birth to two years with hypotonia with poor suck, **OR**
 2. The member is age two to six years with both of the following characteristics:
 - a) Hypotonia with history of poor suck, **AND**
 - b) Global developmental delay, **OR**

3. The member is age six to 12 years with all of the following characteristics:
 - a) History of hypotonia with poor suck (hypotonia often persists), **AND**
 - b) Global developmental delay, **AND**
 - c) Excessive eating with central obesity if uncontrolled, **OR**
 4. The member is age 13 years to adulthood with all of the following characteristics:
 - a) Cognitive impairment, usually mild intellectual disability, **AND**
 - b) Excessive eating with central obesity if uncontrolled, **AND**
 - c) Hypogonadism.
- II. *SNRPN/UBE3A* methylation analysis (81331), FISH analysis for 15q11-q13 deletion (88271, 88273), uniparental disomy analysis (81402), and imprinting center defect analysis (81331) to establish or confirm a diagnosis of Angelman or Prader-Willi syndrome is considered **investigational** for all other indications.

Note: The following is the recommended testing strategy:

1. *SNRPN/UBE3A* methylation analysis
2. If *UBE3A* methylation analysis is normal, then proceed to deletion analysis of 15q11-q13
3. If deletion analysis is normal, consider UPD analysis of chromosome 15
4. If UPD is normal, then proceed to imprinting defect (ID) analysis

[back to top](#)

BECKWITH-WIEDEMANN/RUSSELL-SILVER SYNDROME

H19 and *KCNQ1OT1* methylation analysis, FISH or deletion/duplication analysis of 11p15, uniparental disomy analysis, *CDKN1C* sequencing and/or deletion/duplication analysis

- I. *H19* and *KCNQ1OT1* methylation analysis (81401), FISH or deletion/duplication analysis of 11p15 (81479), uniparental disomy analysis (81402), *CDKN1C* sequencing

and/or deletion/duplication analysis (81479) to confirm or establish a diagnosis of Beckwith-Wiedemann or Russell-Silver syndrome is **medically necessary** when:

- A. The member meets at least 4 of the following 6 Netchine-Harbison clinical scoring system (NH-CSS) clinical features for Russell-Silver syndrome:
 1. Small for gestational age (birth weight and/or length ≥ 2 SD below the mean for gestational age)
 2. Postnatal growth failure (length/height at least 2 SD below the mean at 24 months)
 3. Relative macrocephaly at birth (head circumference greater than 1.5 SD above birth weight and/or length)
 4. Frontal bossing or prominent forehead (forehead projecting beyond the facial plane on a side view as a toddler [1–3 years])
 5. Body asymmetry (limb length discrepancy at least 0.5 cm, or less than 0.5 cm with 2 or more other asymmetric body parts)
 6. Feeding difficulties or body mass index less than or equal to 2 SD at 24 months or current use of a feeding tube or cyproheptadine for appetite stimulation, **OR**

- B. The member meets at least one or more of the following major and/or minor clinical features of Beckwith-Wiedemann syndrome (BWS):
 1. Major criteria for BWS:
 - a) Macrosomia (traditionally defined as weight and length/height greater than 97th centile)
 - b) Macroglossia
 - c) Hemihyperplasia (asymmetric overgrowth of one or more regions of the body)
 - d) Omphalocele (also called exomphalos) or umbilical hernia
 - e) Embryonal tumor (e.g., Wilms tumor, hepatoblastoma, neuroblastoma, rhabdomyosarcoma)
 - f) Visceromegaly involving one or more intra-abdominal organs including liver, spleen, kidneys, adrenal glands, and/or pancreas
 - g) Cytomegaly of the fetal adrenal cortex (pathognomonic)
 - h) Renal abnormalities including structural abnormalities, nephromegaly, nephrocalcinosis, and/or later development of medullary sponge kidney

- i) Anterior linear earlobe creases and/or posterior helical ear pits
- j) Placental mesenchymal dysplasia
- k) Cleft palate (rare in BWS)
- l) Cardiomyopathy (rare in BWS)
- m) Positive family history (at least 1 family member(s) with a clinical diagnosis of BWS or a history or features suggestive of BWS)

2. Minor criteria for BWS

- a) Pregnancy-related findings including polyhydramnios and prematurity
- b) Neonatal hypoglycemia
- c) Vascular lesions including nevus simplex (typically appearing on the forehead, glabella, and/or back of the neck) or hemangiomas (cutaneous or extracutaneous)
- d) Characteristic facies including midface retrusion and infraorbital creases
- e) Structural cardiac anomalies or cardiomegaly
- f) Diastasis recti
- g) Advanced bone age (common in overgrowth/endocrine disorders)

- II. *H19* and *KCNQ1OT1* methylation analysis (81401), FISH or deletion/duplication analysis of 11p15 (81479), uniparental disomy analysis (81402), *CDKN1C* sequencing and/or deletion/duplication analysis (81479) to confirm or establish a diagnosis of Beckwith-Wiedemann or Russell-Silver syndrome is considered **investigational** for all other indications.

[back to top](#)

CADASIL

NOTCH3 Sequencing and/or Deletion/Duplication Analysis

- I. *NOTCH3* sequencing and/or deletion/duplication analysis (81406, 81479) to establish or confirm a diagnosis of CADASIL (cerebral autosomal dominant

arteriopathy with subcortical infarcts and leukoencephalopathy) is considered **medically necessary** when:

- A. Unexplained white matter hyperintensities and a family history of stroke and/or vascular dementia, **OR**
 - B. The member has at least one of the following clinical features of CADASIL:
 - 1. Transient ischemic attacks and ischemic stroke
 - 2. Cognitive impairment, manifesting initially with executive dysfunction, with a concurrent stepwise deterioration due to recurrent strokes to vascular dementia
 - 3. Migraine with aura (mean age of onset of 30 years)
 - 4. Psychiatric disturbances, most frequently mood disturbances and apathy, **AND**
 - C. The member has at least one of the following brain imaging findings of CADASIL:
 - 1. Symmetric and progressive white matter hyperintensities, often involving the anterior temporal lobes and external capsules
 - 2. Lacunes of presumed vascular origin
 - 3. Recent subcortical infarcts
 - 4. Dilated perivascular spaces, sometimes referred to as subcortical lacunar lesions
 - 5. Brain atrophy
 - 6. Cerebral microbleeds
- II. *NOTCH3* sequencing and/or deletion/duplication analysis (81406, 81479) to establish or confirm a diagnosis of CADASIL (cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy) is considered **investigational** for all other indications.

[back to top](#)

CYSTIC FIBROSIS

CFTR Sequencing and/or Deletion/Duplication Analysis

- I. *CFTR* sequencing and/or deletion/duplication analysis (81222, 81223) to establish or confirm a diagnosis of cystic fibrosis is considered **medically necessary** when:
 - A. The member has a positive (at least 60mmol/L) or inconclusive sweat chloride test (30-59mmol/L), **OR**
 - B. The member has unexplained acute recurrent (2 or more episodes) or chronic pancreatitis with documented elevated amylase or lipase levels.
- II. *CFTR* sequencing and/or deletion/duplication analysis (81222, 81223) to establish or confirm a diagnosis of cystic fibrosis is considered **investigational** for all other indications.

CFTR Intron 9 PolyT and TG Analysis (previously called Intron 8 polyT/TG Analysis)

- I. *CFTR* intron 9 polyT and TG analysis (81224) in a member with a diagnosis of cystic fibrosis is considered **medically necessary** when:
 - A. The member has a diagnosis of cystic fibrosis, **AND**
 - B. The member is known to have an R117H variant in the *CFTR* gene.
- II. *CFTR* intron 9 polyT and TG analysis (81224) in a member with a diagnosis of cystic fibrosis is considered **investigational** for all other indications.

[back to top](#)

CHARGE SYNDROME

CHD7 Sequencing and/or Deletion/Duplication Analysis

- I. *CHD7* sequencing and/or deletion/duplication analysis (81407, 81479) to establish or confirm a diagnosis of CHARGE syndrome is considered **medically necessary** when:

A. The member has at least two of the following:

1. Coloboma of the iris, retina, choroid, and/or disc, and/or anophthalmos or microphthalmos
2. Choanal atresia or stenosis, which may be unilateral or bilateral.
3. Cranial nerve dysfunction or anomaly (hyposmia or anosmia, facial palsy (unilateral or bilateral), sensorineural hearing loss and/or balance problems, hypoplasia or aplasia on imaging, difficulty with sucking/swallowing and aspiration, gut motility problems)
4. Ear malformations (the following are the most common):
 - a) Auricle. Short, wide ear with little or no lobe, "snipped-off" helix, prominent antihelix that is often discontinuous with tragus, triangular concha, decreased cartilage; often protruding and usually asymmetric
 - b) Middle ear. Ossicular malformations (resulting in a typical wedge-shaped audiogram due to mixed sensorineural and conductive hearing loss)
 - c) Temporal bone abnormalities (most commonly determined by temporal bone CT scan). Mondini defect of the cochlea (cochlear hypoplasia), absent or hypoplastic semicircular canals
5. Tracheoesophageal fistula or esophageal atresia
6. Cardiovascular malformation, including conotruncal defects (e.g., tetralogy of Fallot), AV canal defects, and aortic arch anomalies
7. Hypogonadotropic hypogonadism with delayed or absent puberty
8. Developmental delay / intellectual disability
9. Growth deficiency (short stature)
10. Distinctive features:
 - a) Face. Square-shaped with broad forehead, broad nasal bridge, prominent nasal columella, flattened malar area, facial

- palsy or other asymmetry, cleft lip, and small chin (gets larger and broader with age)
 - b) Neck. Short and wide with sloping shoulders
 - c) Hands. Typically, short, wide palm with hockey-stick crease, short fingers, and finger-like thumb; polydactyly and reduction defects in a small percentage
11. Brain MRI showing clivus hypoplasia, hypoplasia of cerebellar vermis
- II. *CHD7* sequencing and/or deletion/duplication analysis (81407, 81479) to establish or confirm a diagnosis of CHARGE syndrome is considered **investigational** for all other indications.

[back to top](#)

FANCONI ANEMIA

Fanconi Anemia Multigene Panel

- I. Multigene panel analysis to establish or confirm a genetic diagnosis of Fanconi anemia (81162, 81307, 81479) is considered **medically necessary** when:
- A. The member has had a positive or inconclusive chromosome breakage analysis, **AND**
 - B. The member displays any of the following clinical features of Fanconi anemia:
 - 1. Prenatal and/or postnatal short stature
 - 2. Abnormal skin pigmentation (e.g., café au lait macules, hypopigmentation)
 - 3. Skeletal malformations (e.g., hypoplastic thumb, hypoplastic radius)
 - 4. Microcephaly
 - 5. Ophthalmic anomalies
 - 6. Genitourinary tract anomalies
 - 7. Macrocytosis
 - 8. Increased fetal hemoglobin (often precedes anemia)
 - 9. Cytopenia (especially thrombocytopenia, leukopenia and neutropenia)

10. Progressive bone marrow failure
 11. Adult-onset aplastic anemia
 12. Myelodysplastic syndrome (MDS)
 13. Acute myelogenous leukemia (AML)
 14. Early-onset solid tumors (e.g., squamous cell carcinomas of the head and neck, esophagus, and vulva; cervical cancer; and liver tumors)
 15. Inordinate toxicities from chemotherapy or radiation, **AND**
- C. The panel includes, at a minimum, the following genes: *FANCA*, *FANCC*, and *FANCG*.
- II. Multigene panel analysis to establish or confirm a genetic diagnosis of Fanconi anemia (81162, 81307, 81479) is considered **investigational** for all other indications.

[back to top](#)

FRAGILE X SYNDROME

FMR1 Repeat and Methylation Analysis

- I. *FMR1* repeat and methylation analysis (81243, 81244) to establish or confirm a genetic diagnosis of Fragile X syndrome or Fragile X-associated disorders is considered **medically necessary** when:
- A. The member has unexplained speech and/or language delay, intellectual disability, or autism spectrum disorder, **OR**
 - B. The member has primary ovarian insufficiency (cessation of menses before age 40), **OR**
 - C. The member is 50 years or older with progressive intention tremor and cerebellar ataxia of unknown origin.
- II. *FMR1* repeat and methylation analysis (81243, 81244) to establish or confirm a genetic diagnosis of Fragile X syndrome or Fragile X-associated disorders is considered **investigational** for all other indications.

[back to top](#)

HEREDITARY HEMORRHAGIC TELANGIECTASIA (HHT)

Hereditary Hemorrhagic Telangiectasia (HHT) Multigene Panel

- I. Hereditary hemorrhagic telangiectasia (HHT) multigene panel analysis (81405, 81406, 81479) to establish or confirm a diagnosis of HHT is considered **medically necessary** when:
 - A. The member has any of the following clinical features of HHT:
 1. Spontaneous and recurrent nosebleeds (epistaxis)
 2. Mucocutaneous telangiectases (small blanchable red spots that are focal dilatations of post-capillary venules or delicate, lacy red vessels composed of markedly dilated and convoluted venules) at characteristic sites, including lips, oral cavity, fingers, and nose.
 3. Visceral arteriovenous malformation (AVM), **AND**
 - B. The panel includes, at a minimum, the following genes: *ACVRL1* and *ENG*.
- II. Hereditary hemorrhagic telangiectasia (HHT) multigene panel analysis (81405, 81406, 81479) to establish or confirm a diagnosis of HHT is considered **investigational** for all other indications.

[back to top](#)

LEGIUS SYNDROME

SPRED1 Sequencing and/or Deletion/Duplication Analysis

- I. *SPRED1* sequencing and/or deletion/duplication analysis (81405, 81479) to establish or confirm a diagnosis of Legius syndrome is considered **medically necessary** when:
 - A. The member has multiple café au lait macules, **AND**

- B. The member's personal and family history do not include any of the non-pigmentary clinical diagnostic manifestations of neurofibromatosis type 1 (NF1) (e.g., Lisch nodules, neurofibromas, optic nerve glioma, sphenoid wing dysplasia, long bone dysplasia), **AND**
 - C. The member has previously undergone genetic testing of *NF1* and the results were negative.
- II. *SPRED1* sequencing and/or deletion/duplication analysis (81405, 81479) to establish or confirm a diagnosis of Legius syndrome is considered **investigational** for all other indications.

[back to top](#)

NEUROFIBROMATOSIS

***NF1* or *NF2* Sequencing and/or Deletion/Duplication Analysis or Multigene Panel**

- I. *NF1* or *NF2* sequencing and/or deletion/duplication analysis (81405, 81406, 81408) or multigene panel analysis is considered **medically necessary** when:
 - A. The member has any of the following clinical features of neurofibromatosis:
 1. Six or more café au lait macules (greater than 5 mm in greatest diameter in prepubertal individuals and greater than 15 mm in greatest diameter in postpubertal individuals)
 2. Two or more neurofibromas of any type or one plexiform neurofibroma
 3. Freckling in the axillary or inguinal regions
 4. Optic glioma
 5. Two or more Lisch nodules (iris hamartomas)
 6. A distinctive osseous lesion such as sphenoid dysplasia or tibial pseudarthrosis

7. Bilateral vestibular schwannomas
 8. Unilateral vestibular schwannoma, **AND**
 - a) Any two of the following: meningioma, schwannoma, glioma, neurofibroma, cataract in the form of subcapsular lenticular opacities or cortical wedge cataract
 9. Multiple meningiomas, **AND**
 - a) Unilateral vestibular schwannoma, **OR**
 - b) Any two of the following: schwannoma, glioma, neurofibroma, cataract in the form of subcapsular lenticular opacities or cortical wedge cataract
- II. *NF1* or *NF2* sequencing and/or deletion/duplication analysis (81405, 81406, 81408) or multigene panel analysis is considered **investigational** for all other indications.

[back to top](#)

NOONAN SPECTRUM DISORDERS

Noonan Spectrum Disorders Multigene Panel

- I. The use of a multigene panel to confirm or establish a diagnosis of a Noonan spectrum disorder (e.g., Noonan syndrome, Legius syndrome, Costello syndrome, Cardio-facial-cutaneous syndrome, NF1-related Noonan syndrome) (81442) is considered **medically necessary** when:
 - A. The member has any of the following clinical features of Noonan spectrum disorders:
 1. Characteristic facies (low-set, posteriorly rotated ears with fleshy helices, vivid blue or blue-green irises, wide-spaced, down slanted eyes, epicanthal folds, ptosis)
 2. Short stature
 3. Congenital heart defect (most commonly pulmonary valve stenosis, atrial septal defect, and/or hypertrophic cardiomyopathy)
 4. Developmental delay

5. Broad or webbed neck
 6. Unusual chest shape with superior pectus carinatum, inferior pectus excavatum
 7. Widely set nipples
 8. Cryptorchidism in males
 9. Lentigines
 10. Café au lait macules
- B. The panel includes, at a minimum, the following genes: *PTPN11*, *SOS1*, *RAF1*, and *RIT1*.
- II. The use of a multigene panel to confirm or establish a diagnosis of a Noonan spectrum disorder (e.g., Noonan syndrome, Legius syndrome, Costello syndrome, Cardio-facial-cutaneous syndrome, *NF1*-related Noonan syndrome) (81442) is considered **investigational** for all other indications.

[back to top](#)

PIK3CA-Related Segmental Overgrowth and Related Syndromes

PIK3CA Sequencing and/or Deletion/Duplication Analysis

- I. *PIK3CA* sequencing and/or deletion/duplication analysis (81479) to establish a diagnosis of *PIK3CA*-Related Segmental Overgrowth is considered **medically necessary** when:
 - A. The member displays two or more of the following clinical features
 1. Sporadic and mosaic overgrowth in adipose, muscle, nerve, or skeletal tissues
 2. Vascular malformations including capillary, venous, arteriovenous malformation, or lymphatic
 3. Epidermal nevus, **OR**
 - B. The member displays one or more of the following clinical features, with a congenital or early childhood onset

1. Large isolated lymphatic malformation
 2. Isolated macrodactyly OR overgrown splayed feet/ hands, overgrown limbs
 3. Truncal adipose overgrowth
 4. Hemimegalencephaly (bilateral)/ dysplastic megalencephaly/ focal cortical dysplasia
 5. Epidermal nevus
 6. Seborrheic keratoses
 7. Benign lichenoid keratoses
- II. *PIK3CA* sequencing and/or deletion/duplication analysis (81479) to establish a diagnosis of *PIK3CA*-Related Segmental Overgrowth is considered **investigational** for all other indications.

Note: Because the vast majority of reported *PIK3CA* pathogenic variants are mosaic and acquired, more than one tissue type may need to be tested (e.g., blood, skin, saliva). Failure to detect a *PIK3CA* pathogenic variant does not exclude a clinical diagnosis of *PIK3CA*-associated segmental overgrowth disorders in individuals with suggestive features, given that low-level mosaicism is observed in many individuals.

[back to top](#)

RETT SYNDROME

MECP2 Sequencing and/or Deletion/Duplication Analysis

- I. *MECP2* sequencing and/or deletion/duplication analysis (81302, 81304) to establish or confirm a diagnosis of Rett syndrome is considered **medically necessary** when:
 - A. The member experienced a period of developmental regression (range: ages 1-4 years) followed by recovery or stabilization (range: ages 2-10 years), **AND**
 - B. The member has any of the following:

1. Partial or complete loss of acquired purposeful hand skills
2. Partial or complete loss of acquired spoken language or language skill (e.g., babble)
3. Gait abnormalities: impaired (dyspraxic) or absence of ability
4. Stereotypic hand movements including hand wringing/squeezing, clapping/tapping, mouthing, and washing/rubbing automatisms,
AND

C. The member does **not** have either of the following:

1. Brain injury secondary to peri- or postnatal trauma, neurometabolic disease, or severe infection that causes neurologic problems
2. Grossly abnormal psychomotor development in the first six months of life, with early milestones not being met.

- II. *MECP2* sequencing and/or deletion/duplication analysis (81302, 81304) to establish or confirm a diagnosis of Rett syndrome is considered **investigational** for all other indications.

[back to top](#)

TUBEROUS SCLEROSIS COMPLEX (TSC)

TSC1 and TSC2 Sequencing and/or Deletion Duplication Analysis

- I. *TSC1* and *TSC2* sequencing and/or deletion/duplication analysis (81405, 81406, 81407) to establish or confirm a diagnosis of Tuberous Sclerosis Complex (TSC) is considered **medically necessary** when:
 - A. The member has at least one of the following major features of TSC:
 1. Three or more angiofibromas or fibrous cephalic plaque
 2. Cardiac rhabdomyoma
 3. Multiple cortical tubers and/or radial migration lines
 4. Hypomelanotic macules (3 or more macules which are at least 5 mm in diameter)

5. Lymphangi leiomyomatosis (LAM)
6. Multiple retinal nodular hamartomas
7. Renal angiomyolipoma
8. Shagreen patch
9. Subependymal giant cell astrocytoma (SEGA)
10. Subependymal nodules (SENs)
11. Two or more ungual fibromas, **OR**

B. The member has at least two of the following minor features of TSC:

1. "Confetti" skin lesions (numerous 1- to 3-mm hypopigmented macules scattered over regions of the body such as the arms and legs)
2. Four or more dental enamel pits
3. Two or more intraoral fibromas
4. Multiple renal cysts
5. Nonrenal hamartomas
6. Retinal achromic patch
7. Sclerotic bone lesions

- II. *TSC1* and *TSC2* sequencing and/or deletion/duplication analysis (81405, 81406, 81407) to establish or confirm a diagnosis of Tuberous Sclerosis Complex is considered **investigational** for all other indications.

[back to top](#)

OTHER COVERED MULTISYSTEM INHERITED DISORDERS

The following is a list of conditions that have a known genetic association. Due to their relative rareness, it may be appropriate to cover these genetic tests to establish or confirm a diagnosis.

- I. Genetic testing to establish or confirm one of the following multisystem inherited disorders to guide management is considered **medically necessary** when the member demonstrates clinical features* consistent with the disorder (the list is not meant to be comprehensive, see II below):
 - A. [Alagille syndrome](#)
 - B. [Alport syndrome](#)

- C. [Branchiootorenal spectrum disorder](#)
 - D. [Capillary malformation-arteriovenous malformation syndrome \(CM-AVM syndrome\)](#)
 - E. [Cerebral cavernous malformations](#)
 - F. [Coffin-Siris syndrome](#)
 - G. [Cornelia de Lange syndrome](#)
 - H. [FGFR2 craniosynostosis syndromes](#)
 - I. [Holoprosencephaly](#)
 - J. [Holt-Oram syndrome](#)
 - K. [Hypohidrotic ectodermal dysplasia](#)
 - L. [Incontinentia pigmenti](#)
 - M. [Joubert and Meckel-Gruber syndromes](#)
 - N. [Kabuki syndrome](#)
 - O. [MYH9-related disorders](#)
 - P. [Proteus syndrome](#)
 - Q. [Pseudoxanthoma elasticum](#)
 - R. [Rubinstein-Taybi syndrome](#)
 - S. [Schwannomatosis](#)
 - T. [SHOX deficiency disorders](#)
 - U. [Waardenburg syndrome](#)
- II. Genetic testing to establish or confirm the diagnosis of all other multisystem inherited disorders not specifically discussed within this or another medical policy will be evaluated by the criteria outlined in *General Approach to Genetic Testing* (see policy coverage criteria).

*Clinical features for a specific disorder may be outlined in resources such as [GeneReviews](#), [OMIM](#), [National Library of Medicine](#), [Genetics Home Reference](#) or other scholarly source.

[back to top](#)

NOTES AND DEFINITIONS

1. **Close relatives** include first, second, and third degree blood relatives on the same side of the family:
 - a. **First-degree relatives** are parents, siblings, and children

- b. **Second-degree relatives** are grandparents, aunts, uncles, nieces, nephews, grandchildren, and half siblings
 - c. **Third-degree relatives** are great grandparents, great aunts, great uncles, great grandchildren, and first cousins
- 2. **Autism spectrum disorders:** is defined in the DSM V as persistent deficits in social communication and social interaction across multiple contexts, as manifested by the following, currently or by history:
 - a. Deficits in social-emotional reciprocity, ranging, for example, from abnormal social approach and failure of normal back-and-forth conversation; to reduced sharing of interests, emotions, or affect; to failure to initiate or respond to social interactions.
 - b. Deficits in nonverbal communicative behaviors used for social interaction, ranging, for example, from poorly integrated verbal and nonverbal communication; to abnormalities in eye contact and body language or deficits in understanding and use of gestures; to a total lack of facial expressions and nonverbal communication.
 - c. Deficits in developing, maintaining, and understanding relationships, ranging, for example, from difficulties adjusting behavior to suit various social contexts; to difficulties in sharing imaginative play or in making friends; to absence of interest in peers.
- 3. **Congenital anomalies** according to ACMG are multiple anomalies not specific to a well-delineated genetic syndrome. These anomalies are structural or functional abnormalities usually evident at birth, or shortly thereafter, and can be consequential to an individual's life expectancy, health status, physical or social functioning, and typically require medical intervention.
- 4. **Developmental delay** is a slow-to-meet or not reaching milestones in one or more of the areas of development (communication, motor, cognition, social-emotional, or, adaptive skills) in the expected way for a child's age
- 5. **Intellectual disability (ID)** is defined by the DSM V as
 - a. Deficits in intellectual functions, such as reasoning, problem solving, planning, abstract thinking, judgment, academic learning, and learning from experience, confirmed by both clinical assessment and individualized, standardized intelligence testing.

- b. Deficits in adaptive functioning that result in failure to meet developmental and sociocultural standards for personal independence and social responsibility. Without ongoing support, the adaptive deficits limit functioning in one or more activities of daily life, such as communication, social participation, and independent living, across multiple environments, such as home, school, work, and community.
 - c. Onset of intellectual and adaptive deficits during the developmental period.
6. **Idiopathic growth delay** is a deficit in the height or growth of a person for which no underlying cause has been identified.

BACKGROUND AND RATIONALE

Chromosomal Microarray Analysis

American Academy of Pediatrics

The American Academy of Pediatrics (2014) issued a clinical report on the optimal medical genetics evaluation of a child with developmental delays (DD) or intellectual disability (ID), which stated “CMA [chromosome microarray analysis] now should be considered a first-tier diagnostic test in all children with [global] GDD/ID for whom the causal diagnosis is not known.... CMA is now the standard for diagnosis of patients with GDD/ID, as well as other conditions, such as autism spectrum disorders or multiple congenital anomalies.” (page e905)

American College of Medical Genetics and Genomics (ACMG)

The ACMG (2010) published guidelines on array-based technologies and their clinical utilization for detecting chromosomal abnormalities. CMA testing for copy number variants was recommended as a first-line test in the initial postnatal evaluation of individuals with the following:

- Multiple anomalies not specific to a well-delineated genetic syndrome
- Apparently nonsyndromic DD/ID
- ASD [autism spectrum disorder] (page 744)

CMA is considered investigational for all other indications, including members with idiopathic growth delay (ACMG 2010 Practice Guideline, page 744; reaffirmed in 2020 and reclassified as a Clinical Practice Resource) and isolated speech/language delay (AAP 2014 Clinical Report, page e905), as diagnostic yield in these clinical situations is thought to be low.

Developmental Delay/Intellectual Disability, Autism Spectrum Disorder, or Congenital Anomalies Panel Analysis

American Academy of Pediatrics (AAP)

The AAP most recent guideline for identification, evaluation and management of children with autism spectrum disorders did not address the use of multigene panels. Their recommendations for genetic testing in this population include chromosomal microarray, fragile X, Rett syndrome, and/or possibly whole exome sequencing (Hyman et al, 2020).

American Academy of Neurology

The American Academy of Neurology (Michaelson et al, 2011) does not comment or provide evidence to support the use of panel-based analysis for genetic and metabolic evaluation of children with global developmental delay or intellectual disability.

American Academy of Child and Adolescent Psychiatry

In their practice parameter for the assessment and treatment of autism spectrum disorders (Volkmar et al, 2014), the guideline does not mention or recommend the use of Developmental Delay/Intellectual Disability, Autism Spectrum Disorder, or Congenital Anomalies Panel Tests.

Angelman/Prader-Willi Syndrome

GeneReviews is an expert-authored review of current literature on a genetic disease, and goes through a rigorous editing and peer review process before being published online.

The recommended diagnostic criteria testing for Angelman syndrome and Prader-Willi syndrome are as follows:

GeneReviews: Angelman Syndrome

AS [Angelman syndrome] should be suspected in individuals with the following clinical, laboratory, and radiographic findings.

- ...Delayed attainment of developmental milestones by age six to 12 months, eventually classified as severe, without loss of skills
- Speech impairment, with minimal to no use of words; receptive language skills and nonverbal communication skills higher than expressive language skills
- Movement or balance disorder, usually ataxia of gait and/or tremulous movement of the limbs
- Behavioral uniqueness including any combination of frequent laughter/smiling, apparent happy demeanor, excitability (often with hand-flapping movements), and hypermotoric behavior

GeneReviews: Prader-Willi Syndrome

The presence of all of the following findings at the age indicated is sufficient to justify DNA methylation analysis for PWS [Prader-Willi syndrome]:

Birth to age two years

- Hypotonia with poor suck (neonatal period)

Age two to six years

- Hypotonia with history of poor suck
- Global developmental delay

Age six to 12 years

- History of hypotonia with poor suck (hypotonia often persists)
- Global developmental delay
- Excessive eating with central obesity if uncontrolled

Age 13 years to adulthood

- Cognitive impairment, usually mild intellectual disability
- Excessive eating with central obesity if uncontrolled

- Hypothalamic hypogonadism and/or typical behavior problems

Cystic Fibrosis

American Society for Reproductive Medicine in partnership with the Society for Male Reproduction and Urology

Consensus-based guidelines from the American Society for Reproductive Medicine in partnership with the Society for Male Reproduction and Urology (2008) recommend cystic fibrosis testing for men with CAVD and their partners, stating that “A man with CBAVD should be assumed to harbor a CFTR mutation. Therefore, before any treatments using his sperm, testing should be offered to the female partner to exclude the possibility (approximately 4%) that she too may be a carrier. All such couples should be offered genetic counseling.”

Cystic Fibrosis Foundation

Consensus-based guidelines from the Cystic Fibrosis Foundation (2017) outline the ways in which a CF diagnosis can be established (see below). Characteristic features of CF include chronic sinopulmonary disease (such as persistent infection with characteristic CF pathogens, chronic productive cough, bronchiectasis, airway obstruction, nasal polyps, and digital clubbing), gastrointestinal/nutritional abnormalities (including meconium ileus, pancreatic insufficiency, chronic pancreatitis, liver disease, and failure to thrive), salt loss syndromes, and obstructive azoospermia in males (due to CAVD).

These guidelines state that, “Individuals presenting with a positive newborn screen, symptoms of CF, or a positive family history, and sweat chloride values in the intermediate range (30- 59 mmol/L) on 2 separate occasions may have CF. They should be considered for extended CFTR gene analysis and/ or CFTR functional analysis.”

When at least one characteristic feature is present, a diagnosis of CF can be confirmed by:

- Two abnormal sweat chloride values
- Identification of two CFTR gene mutations
- Characteristic transepithelial nasal potential difference (NPD)

In the absence of symptoms, a CF diagnosis can be established in:

- A newborn with two CFTR gene mutations identified via newborn screening
- A pregnancy found to have two CFTR mutations on prenatal testing

Fanconi Anemia

Fanconi Anemia Research Foundation

The Fanconi Anemia Research Foundation (2014) issued guidelines on diagnosis and management of the disease, which stated the following in regard to genetic testing:

“In the last few years, the development of next-generation sequencing (NGS) methodology, also referred to as massively parallel sequencing, has transformed the field of genetic testing because it enables detailed analysis of thousands of genes simultaneously (i.e., in parallel). Such analyses would be too time-consuming and costly to attempt using classic DNA sequencing methodologies, such as Sanger sequencing, that analyze a single gene at a time. Many laboratories have developed targeted panels of genes to be assessed by NGS to search for mutations among a group of genes that have been previously documented or have been suggested to be important in a particular disease. Such panels may include anywhere from a few genes to greater than 500. The number of genes examined varies from laboratory to laboratory depending on the testing platform and algorithm being used.”

Fragile X Syndrome

American College of Medical Genetics and Genomics (ACMG)

The ACMG (2005) made the following recommendations on diagnostic testing for fragile X syndrome (FXS).

- Individuals of either sex with mental retardation, developmental delay, or autism, especially if they have (a) any physical or behavioral characteristics of fragile X syndrome, (b) a family history of fragile X syndrome, or (c) male or female relatives with undiagnosed mental retardation. (page 586)
- Women who are experiencing reproductive or fertility problems associated with elevated follicle stimulating hormone (FSH) levels, especially if they have (a) a family history of premature ovarian failure, (b) a family history of fragile X

syndrome or (c) male or female relatives with undiagnosed mental retardation. (page 586)

- Men and women who are experiencing late onset intentional tremor and cerebellar ataxia of unknown origin, especially if they have (a) a family history of movement disorders, (b) a family history of fragile X syndrome, or (c) male or female relatives with undiagnosed mental retardation. (page 586)

GeneReviews (last update: November 21, 2019) recommends that *FMR1* testing be considered for any patient with the following clinical findings:

- Males and females with intellectual disability or developmental delay of unknown cause
- Males and females who are experiencing late-onset intention tremor and cerebellar ataxia of unknown cause. Men and women with dementia may also be considered, if ataxia, parkinsonism, or tremor are also present.
- Females with unexplained primary ovarian insufficiency or failure (hypergonadotropic hypogonadism) before age 40 years

Neurofibromatosis Type 1

American Academy of Pediatrics

The American Academy of Pediatrics (2019) published diagnostic and health supervision guidance for children with neurofibromatosis type 1 (NF1), which stated the following regarding genetic testing:

"NF1 genetic testing may be performed for purposes of diagnosis or to assist in genetic counseling and family planning. If a child fulfills diagnostic criteria for NF1, molecular genetic confirmation is usually unnecessary. For a young child who presents only with [café-au-lait macules], *NF1* genetic testing can confirm a suspected diagnosis before a second feature, such as skinfold freckling, appears. Some families may wish to establish a definitive diagnosis as soon as possible and not wait for this second feature, and genetic testing can usually resolve the issue" and "Knowledge of the *NF1* [pathogenic sequence variant] can enable testing of other family members and prenatal diagnostic testing."

The guidance includes the following summary and recommendations about genetic testing:

- can confirm a suspected diagnosis before a clinical diagnosis is possible;

- can differentiate NF1 from Legius syndrome;
- may be helpful in children who present with atypical features;
- usually does not predict future complications; and
- may not detect all cases of NF1; a negative genetic test rules out a diagnosis of NF1 with 95% (but not 100%) sensitivity

PIK3CA Sequencing and/or Deletion/Duplication Analysis

Kepler-Noreuil et al (2015)

Kepler-Noreuil et al published outcomes from a workshop that included experts on *PIK3CA* syndromes, and established clinical criteria for diagnosis and treatment of this collection of disorders. They propose the umbrella term of “*PIK3CA*-Related Overgrowth Spectrum (PROS)”, which includes macrodactyly, FAO, HHML, CLOVES, and related megalencephaly conditions. Identification of a *PIK3CA* mutation is included as part of the clinical criteria.

Rett Syndrome

American Academy of Pediatrics

A 2007 policy statement from the American Academy of Pediatrics, reaffirmed in 2014, recommended *MECP2* testing to confirm a diagnosis of suspected Rett syndrome (RTT), especially when the diagnosis was unclear from symptoms alone.

Neither the American Academy of Neurology nor the American Academy of Pediatrics has provided recommendations on when to use *CDKL5* or *FOXG1* testing.

American College of Medical Genetics and Genomics (ACMG)

The American College of Medical Genetics and Genomics (2013) revised its evidence-based guidelines for clinical genetics evaluation of autism spectrum disorders. Testing for *MECP2* genetic variants was recommended as part of the diagnostic workup of females who present with an autistic phenotype. Routine *MECP2* testing in males with autism spectrum disorders was not recommended.

Tuberous Sclerosis

International TSC Clinical Consensus Group

“The International TSC Clinical Consensus Group reaffirms the importance of independent genetic diagnostic criteria and clinical diagnostic criteria. Identification of a pathogenic variant in *TSC1* or *TSC2* is sufficient for the diagnosis or prediction of TSC regardless of clinical findings; this is important because manifestations of TSC are known to arise over time at various ages. Genetic diagnosis of TSC prior to an individual meeting clinical criteria for TSC is beneficial to ensure that individuals undergo necessary surveillance to identify manifestations of TSC as early as possible to enable optimal clinical outcomes.”

“All individuals should have a three-generation family history obtained to determine if additional family members are at risk of the condition. Genetic testing is recommended for genetic counseling purposes or when the diagnosis of TSC is suspected or in question but cannot be clinically confirmed.”

“Definite TSC: 2 major features or 1 major feature with 2 minor features.

Possible TSC: either 1 major feature or 2 minor features.”
